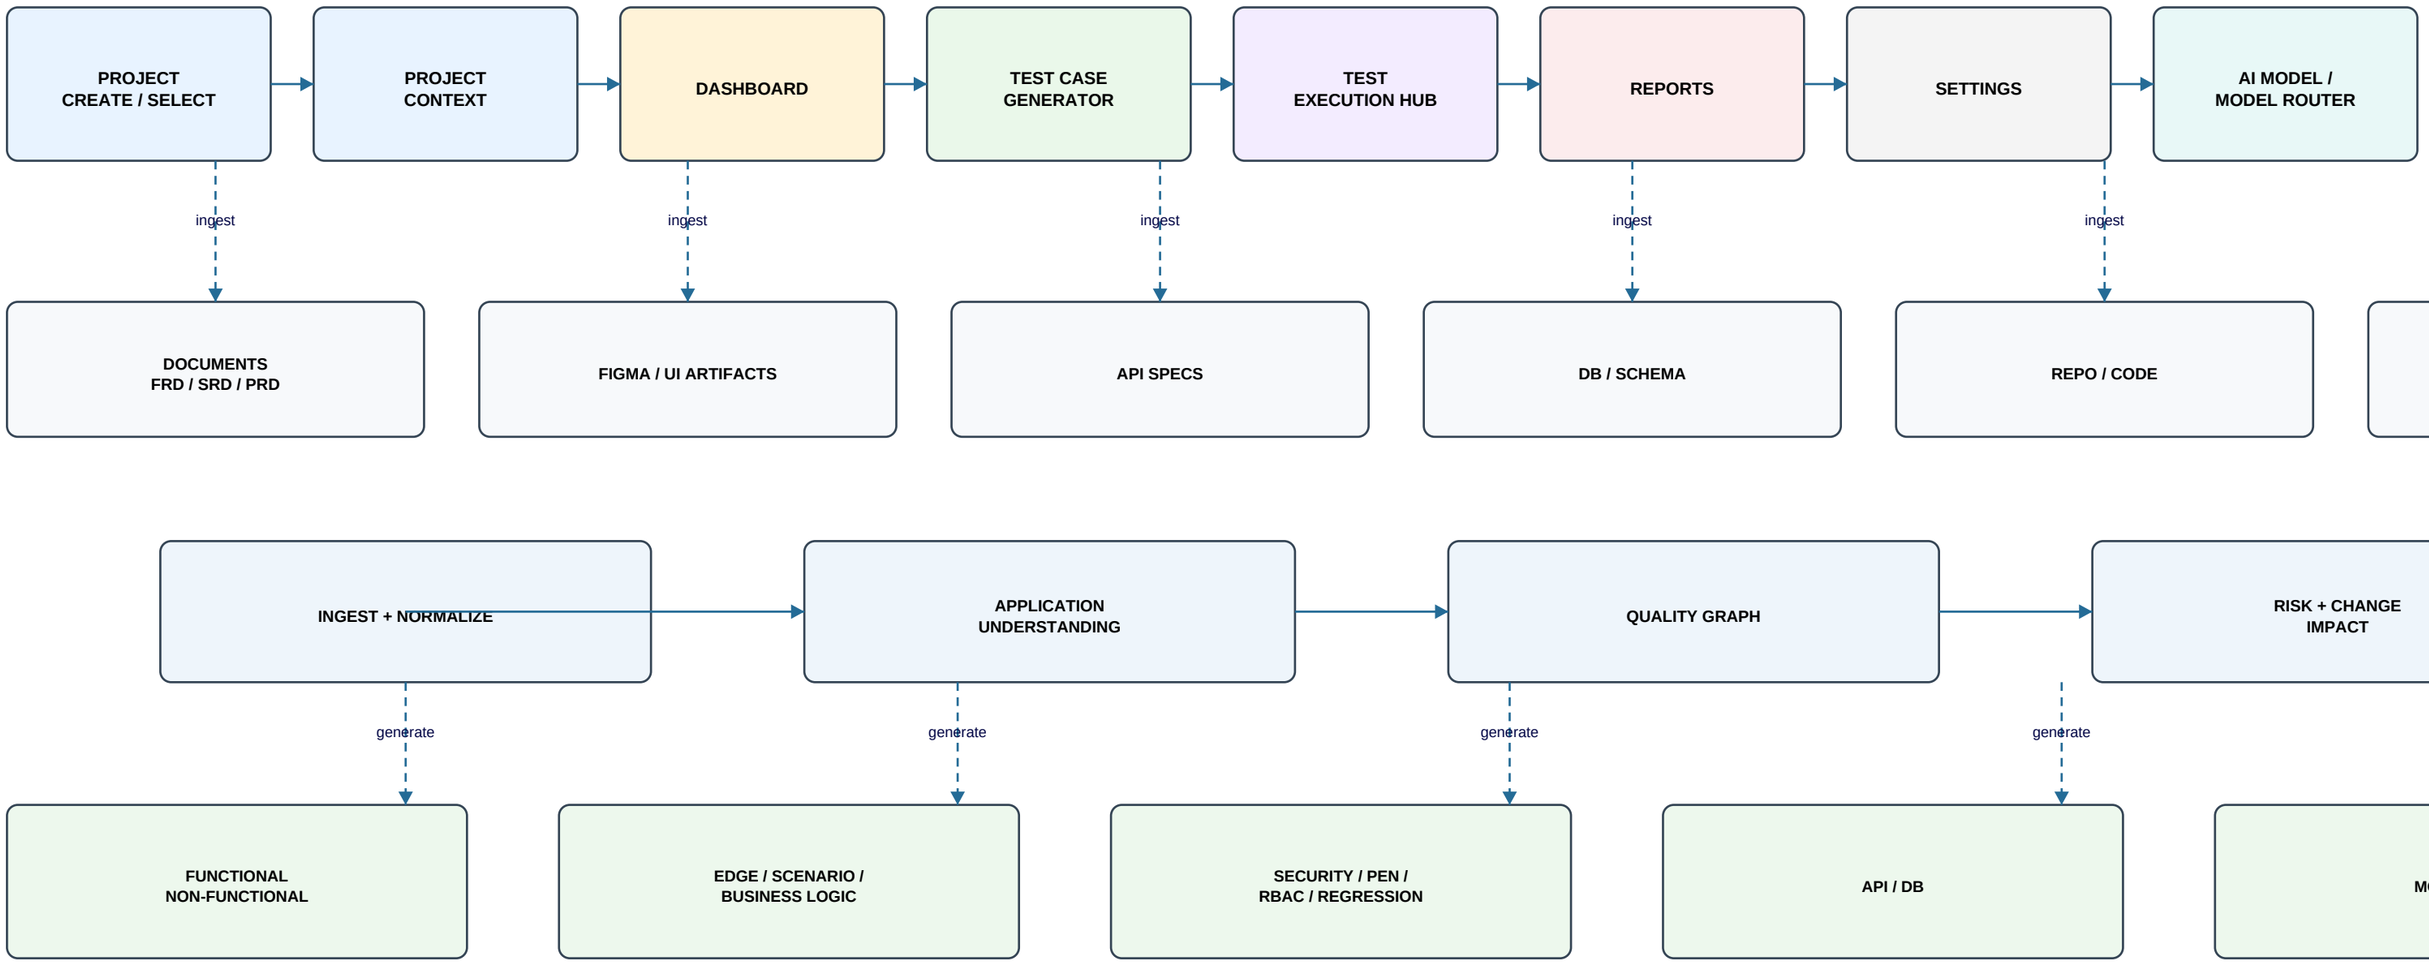
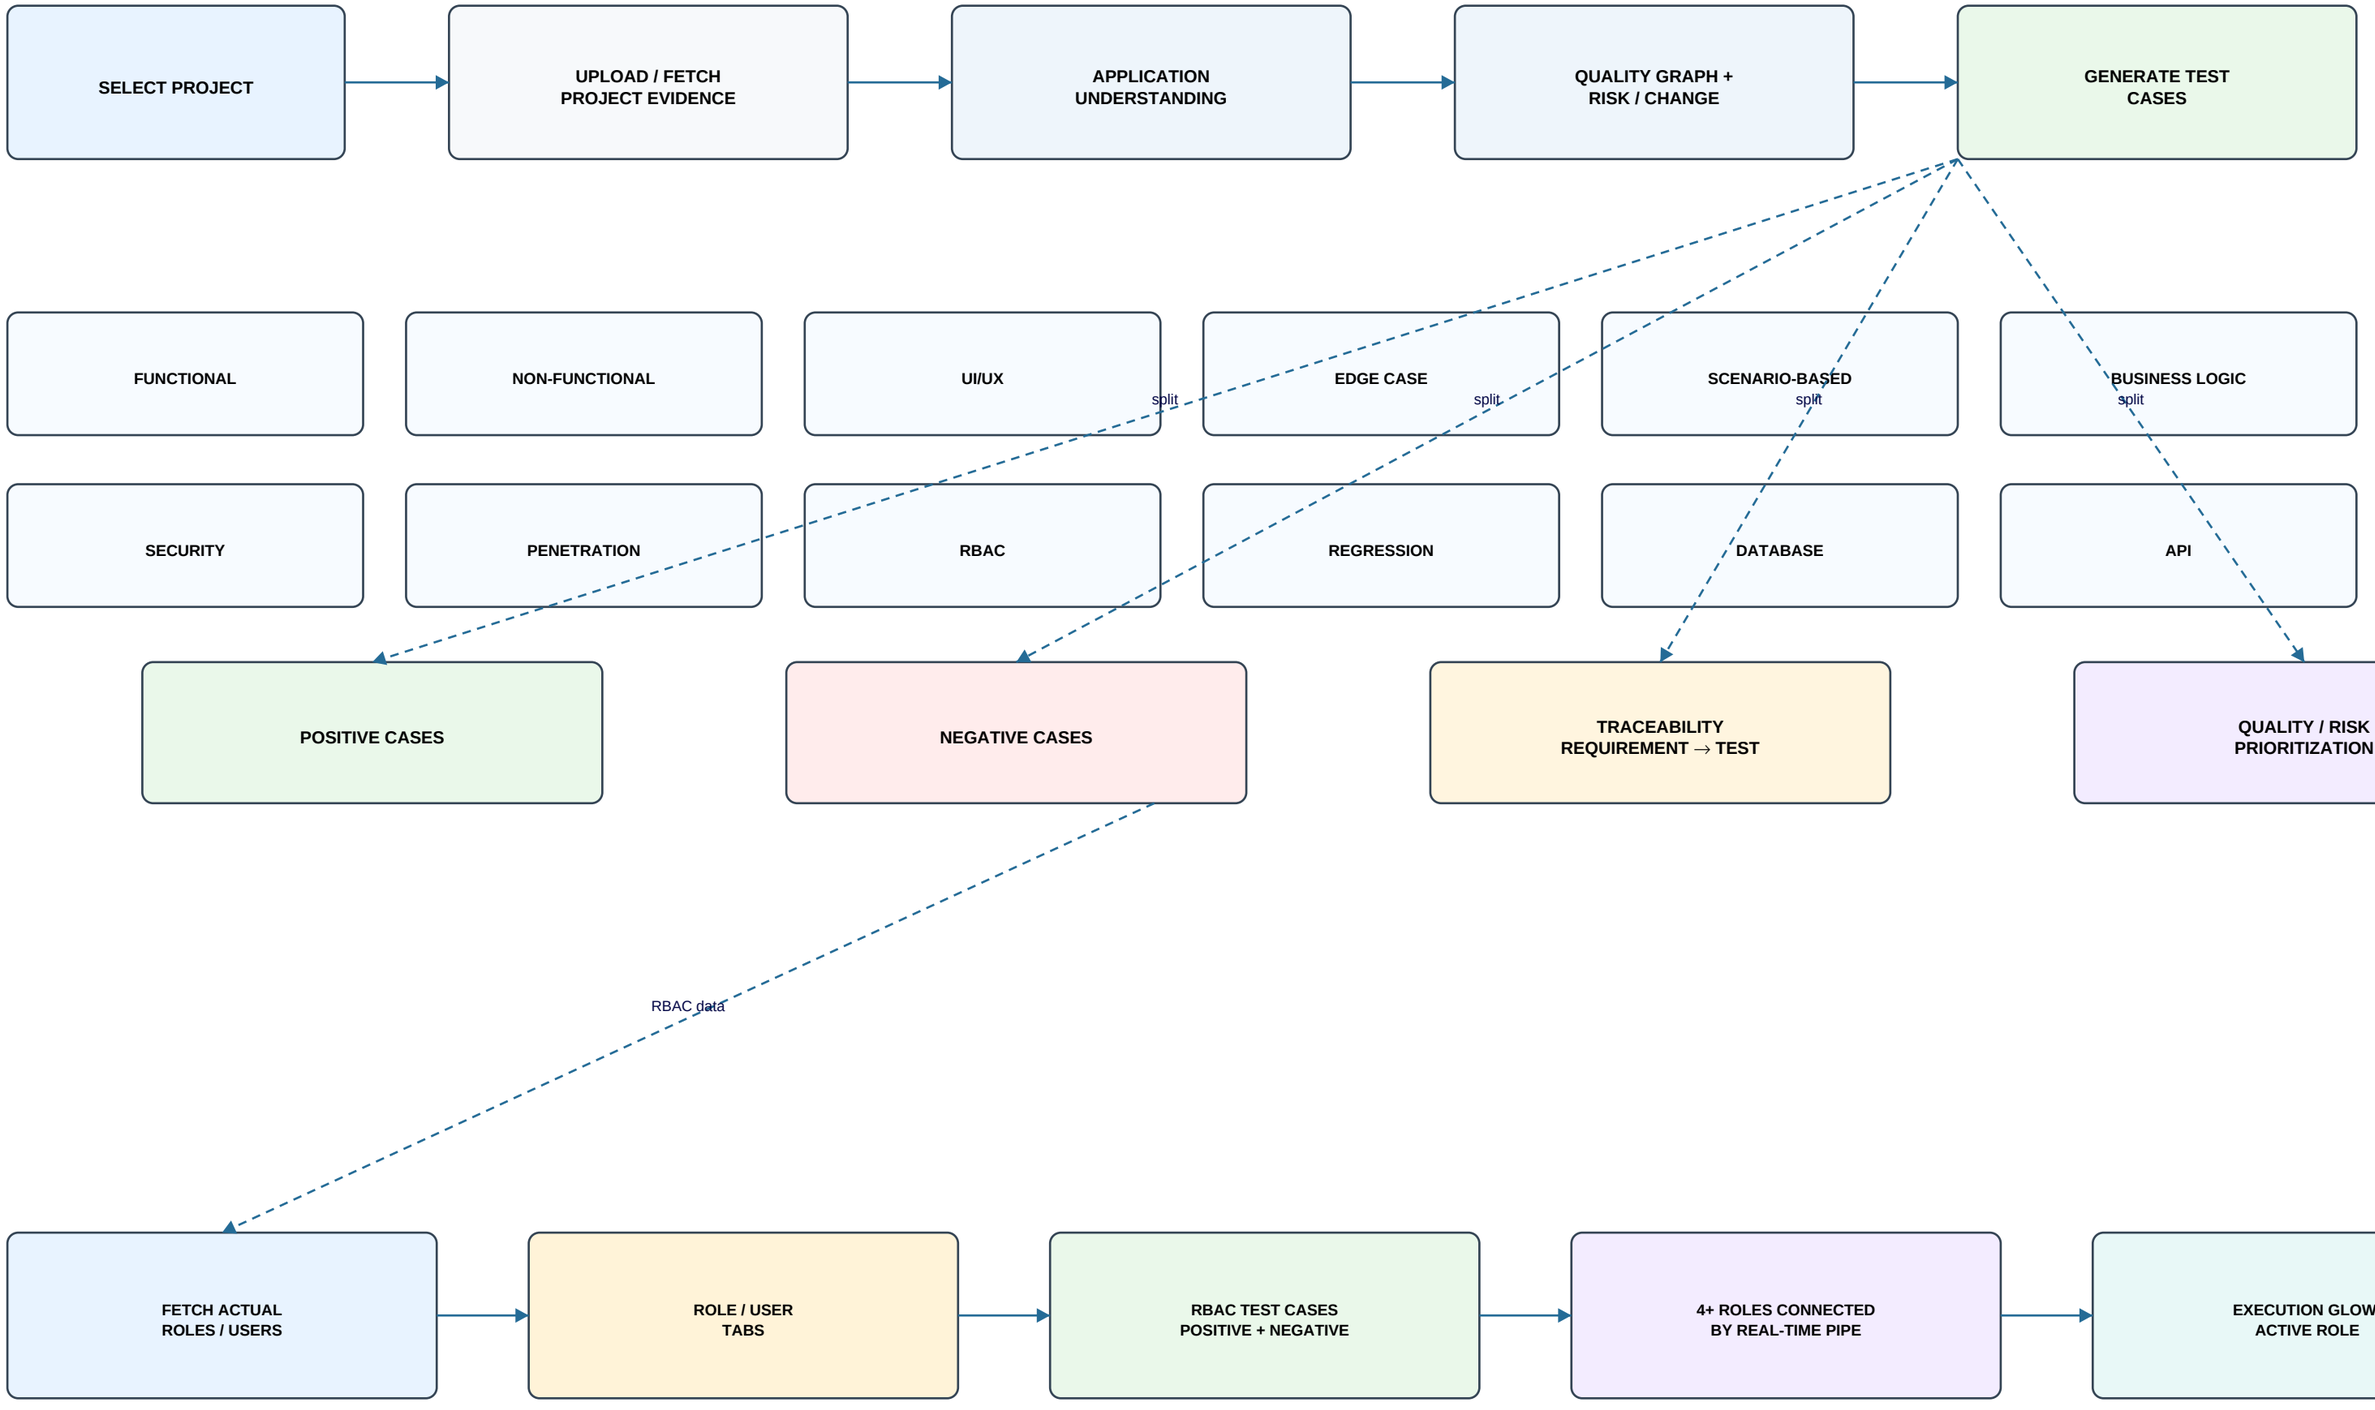
AIQA — Complete Product End-to-End Flow

Project-centric flow covering Dashboard → Generation → Testing → Execution → Reports → Settings → AI Model



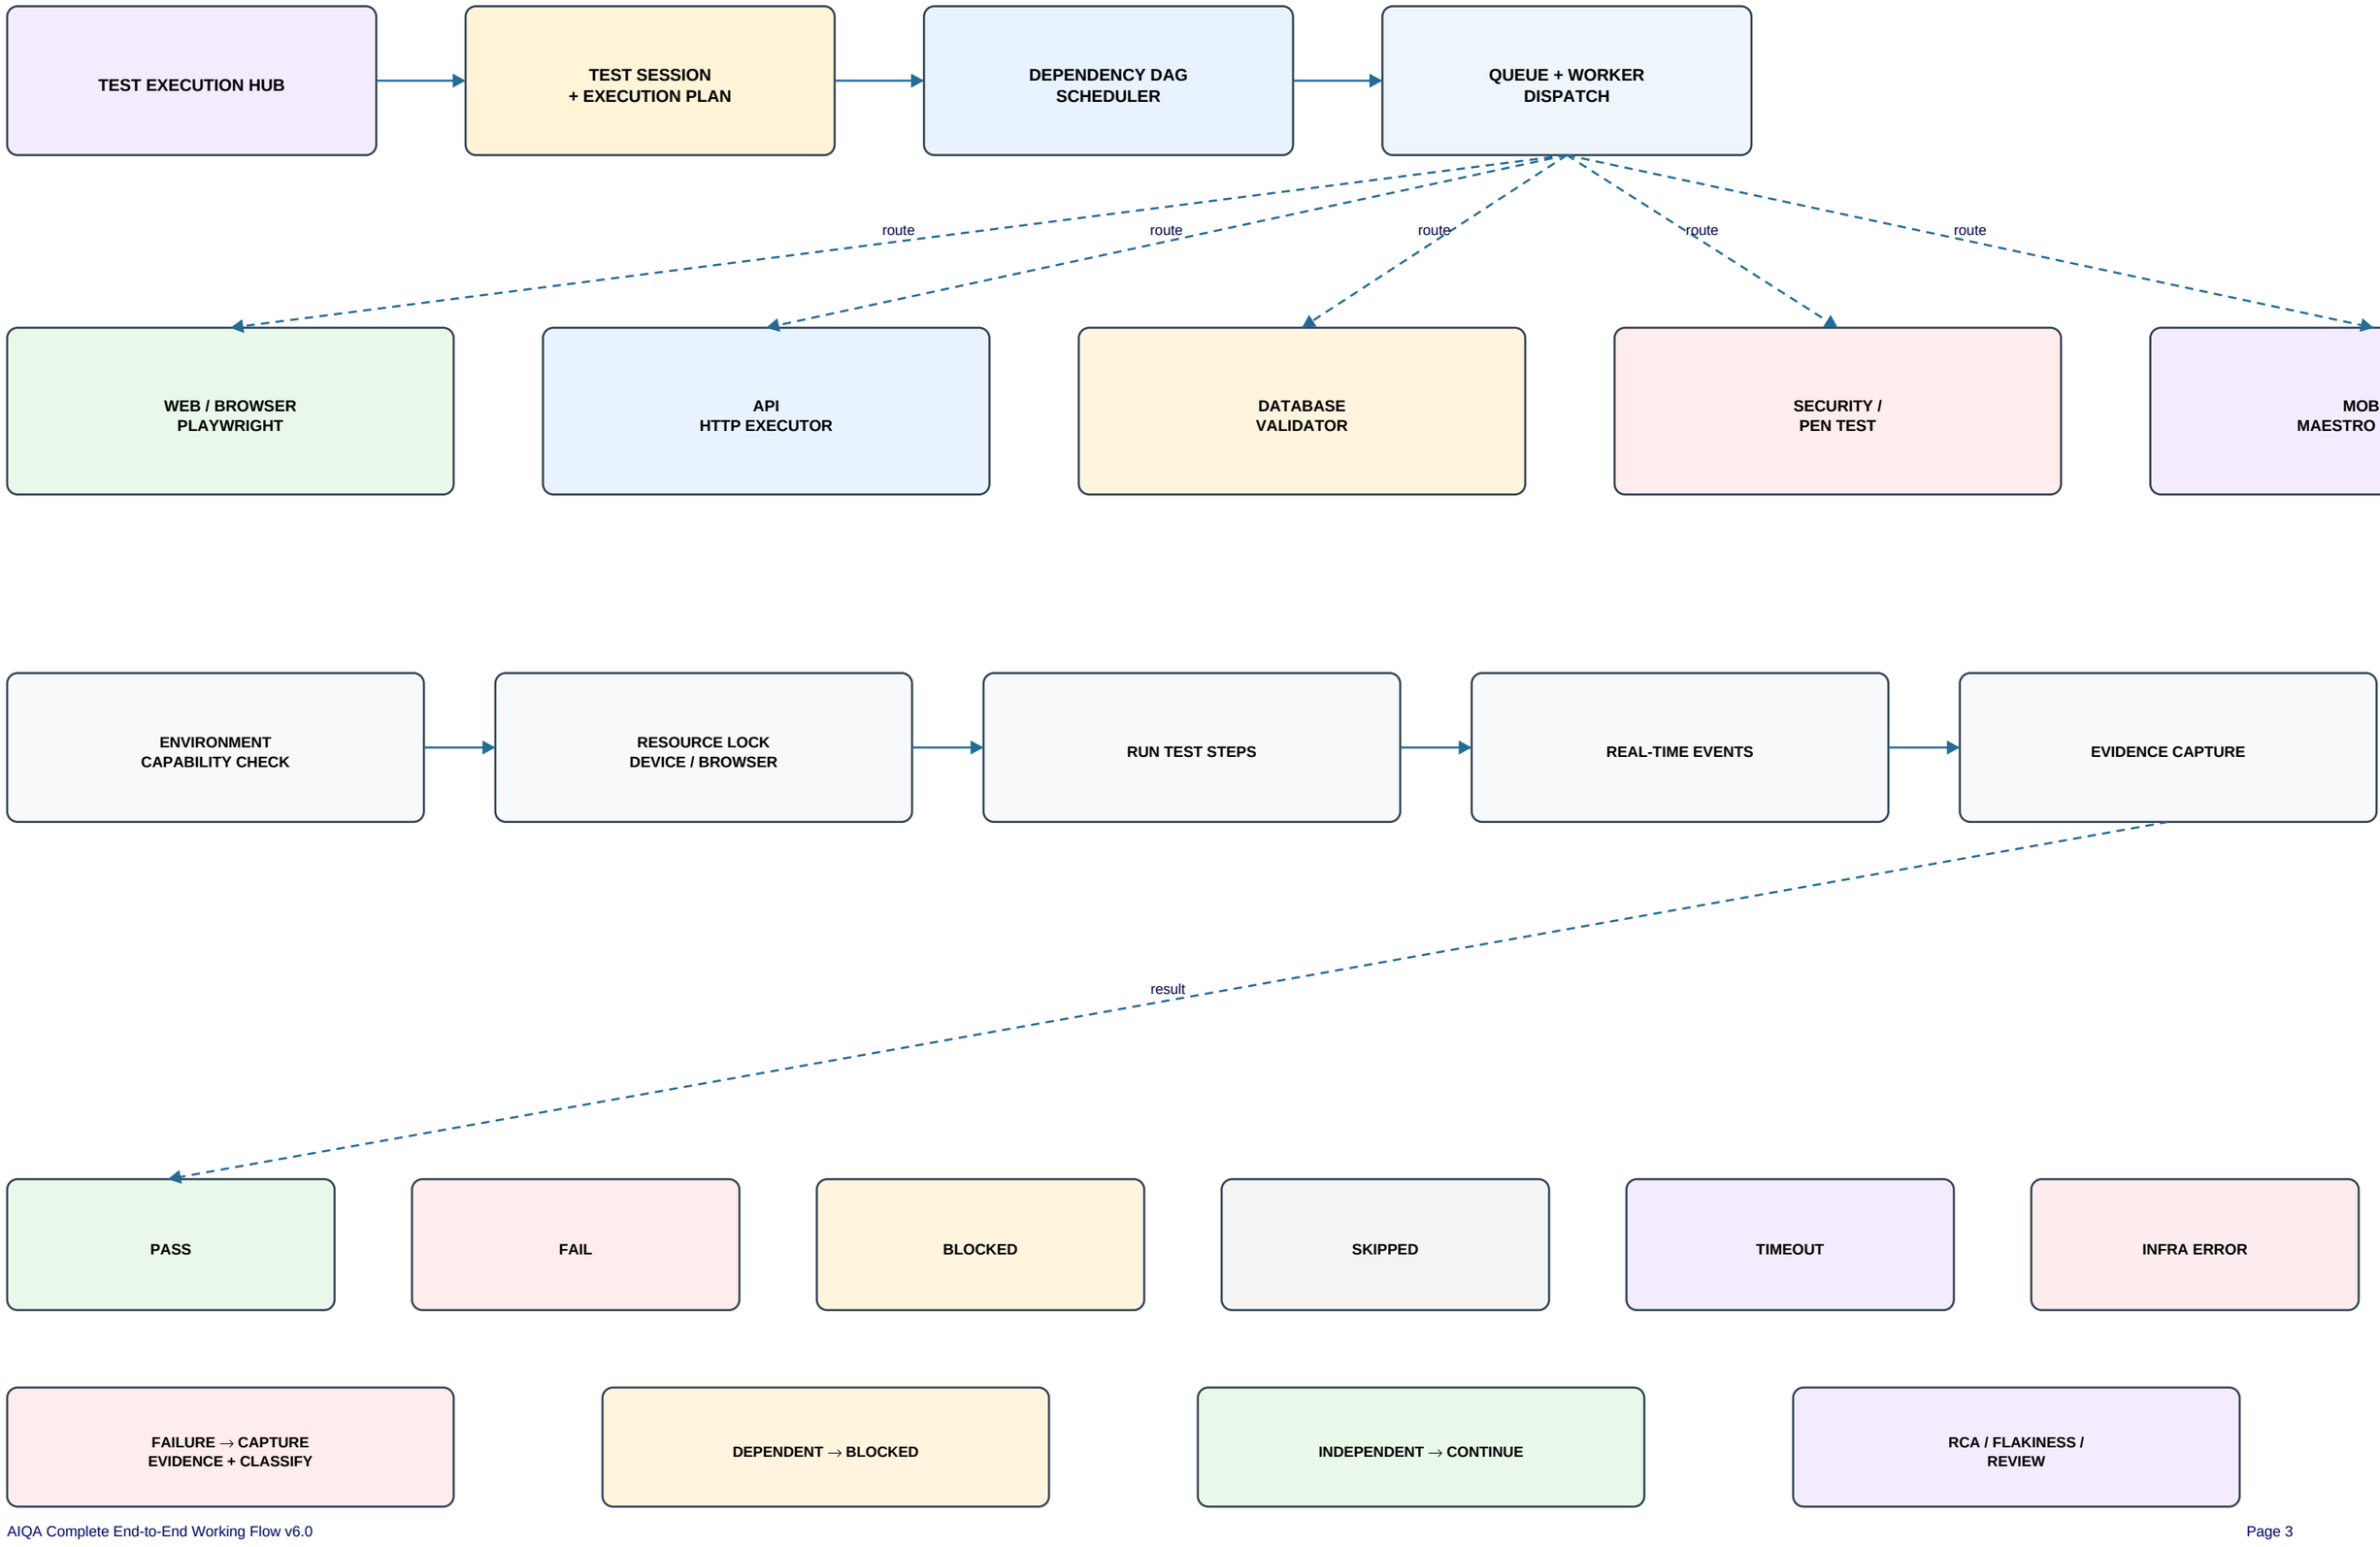
AIQA — Test Case Generation + RBAC Flow

One project context feeds all test categories; RBAC is data-driven from actual project roles/users



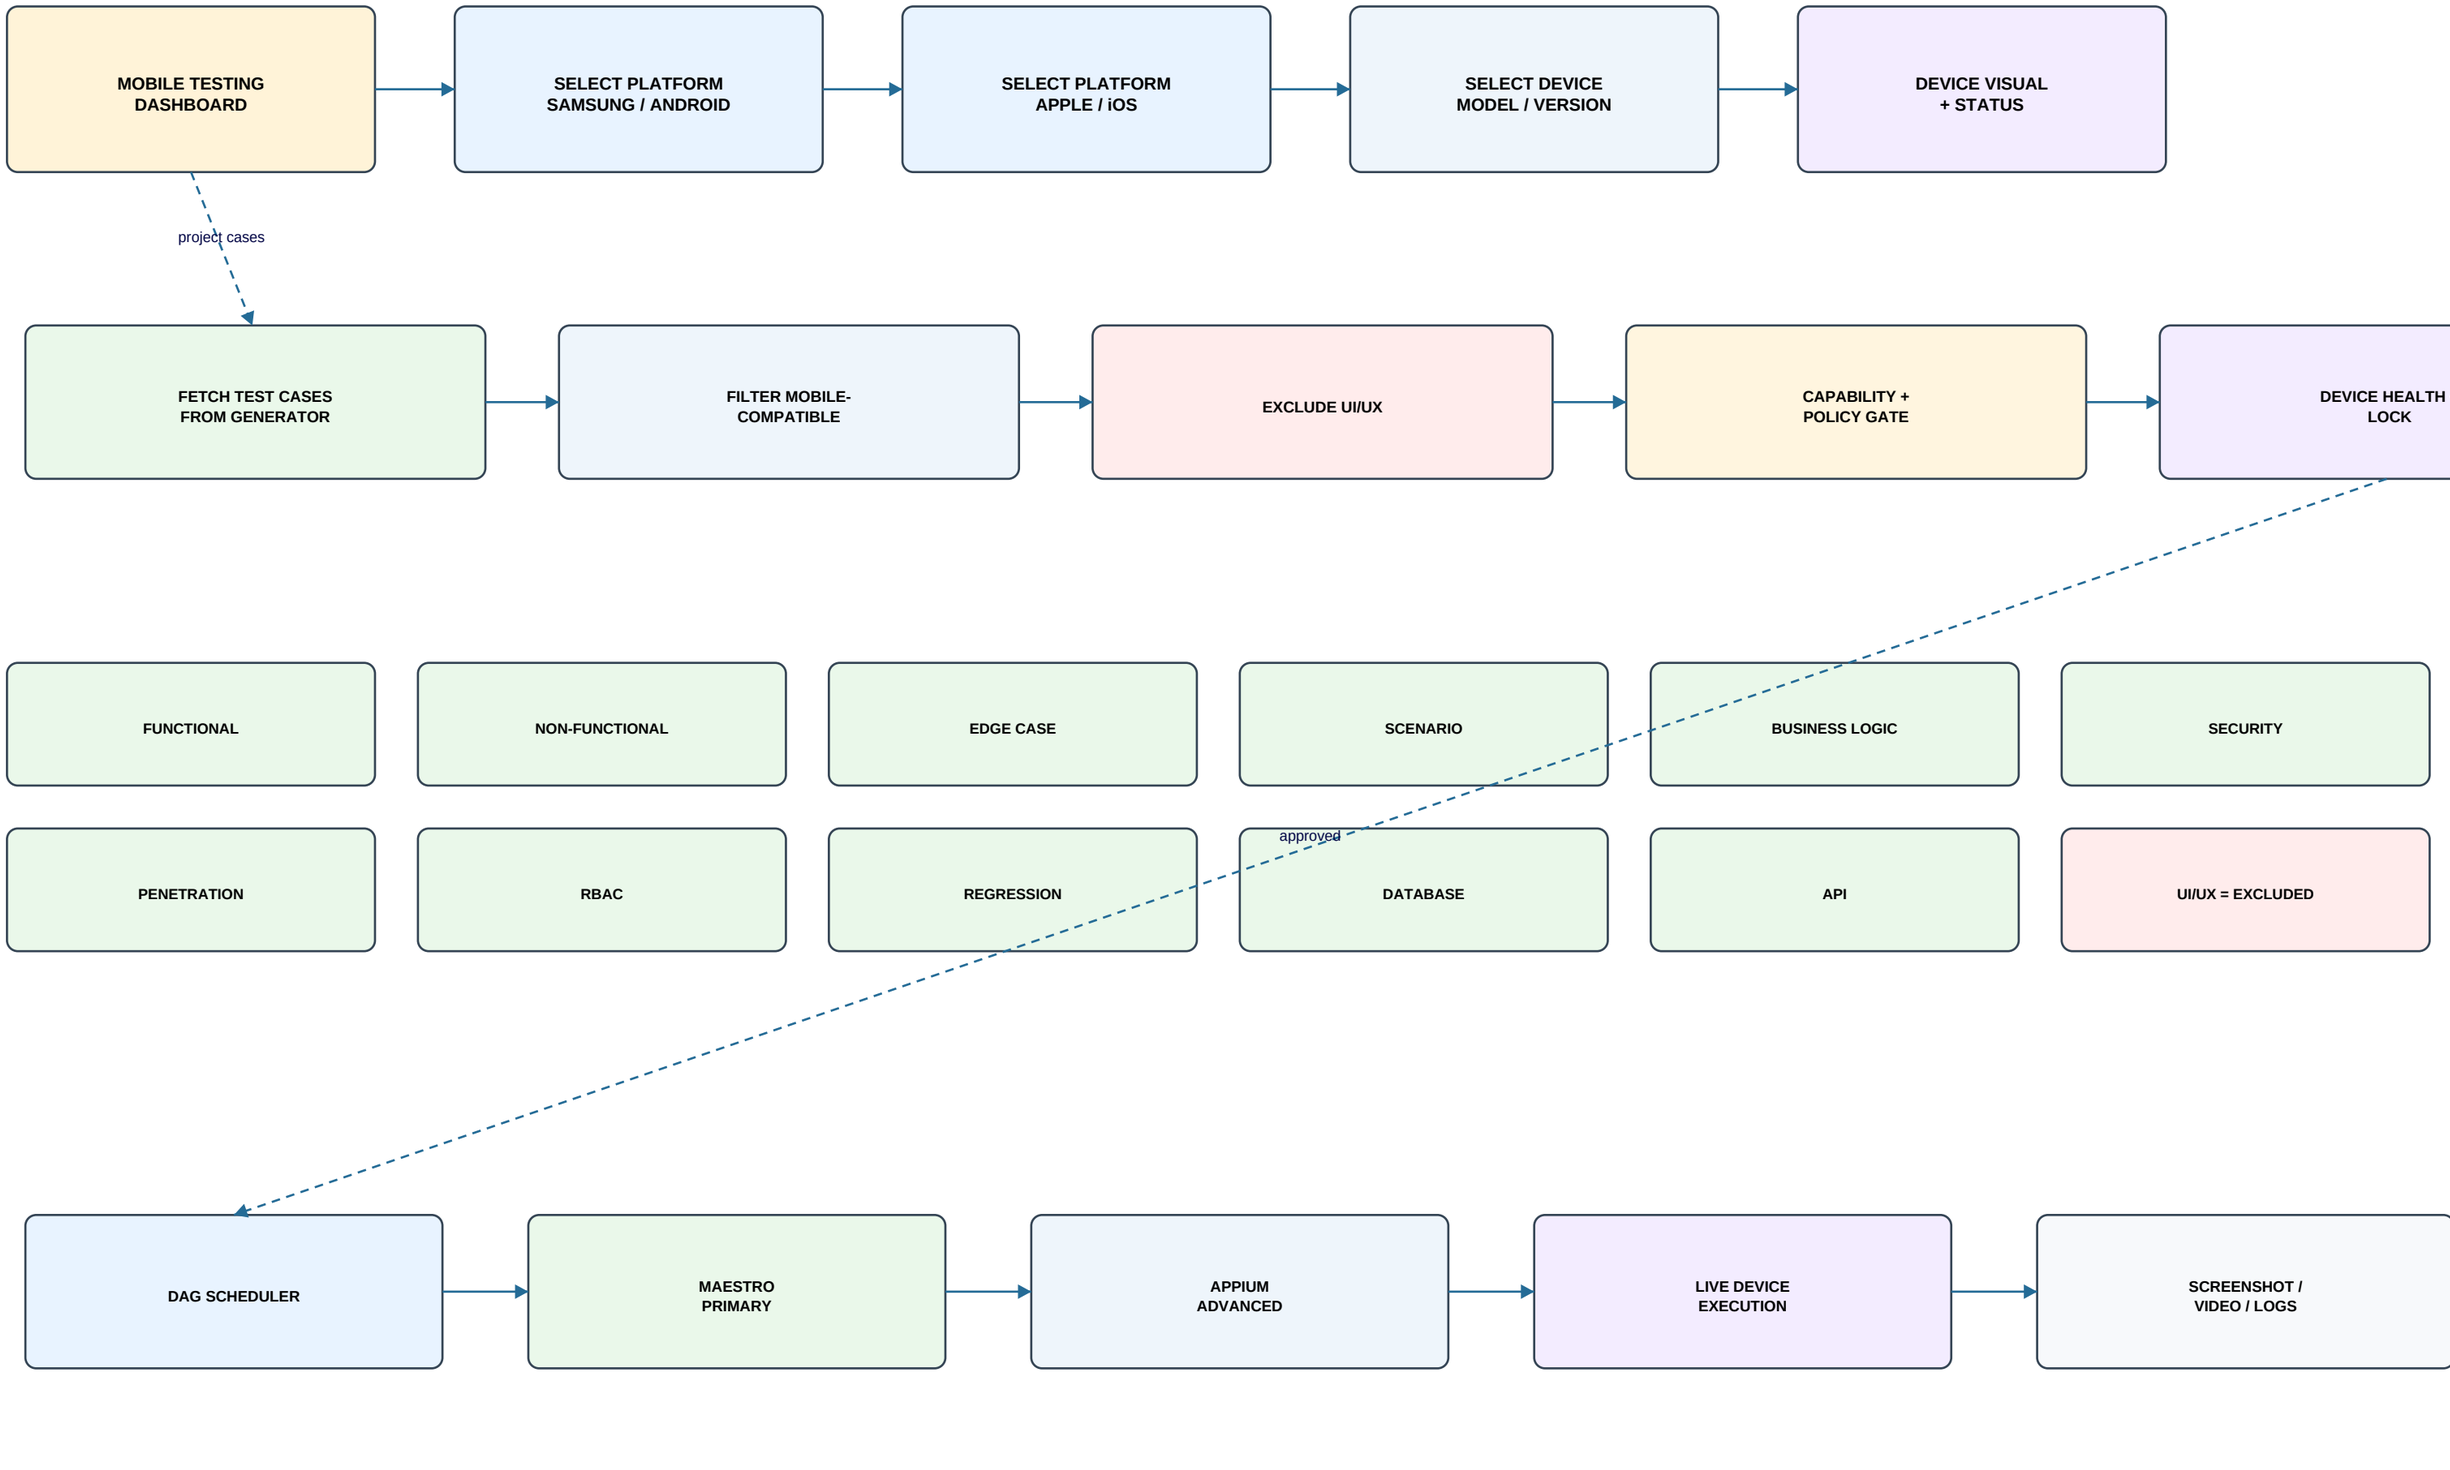
AIQA — Test Execution Hub: Full Execution Architecture

Generated tests are routed to specialized executors; failures do not stop independent work



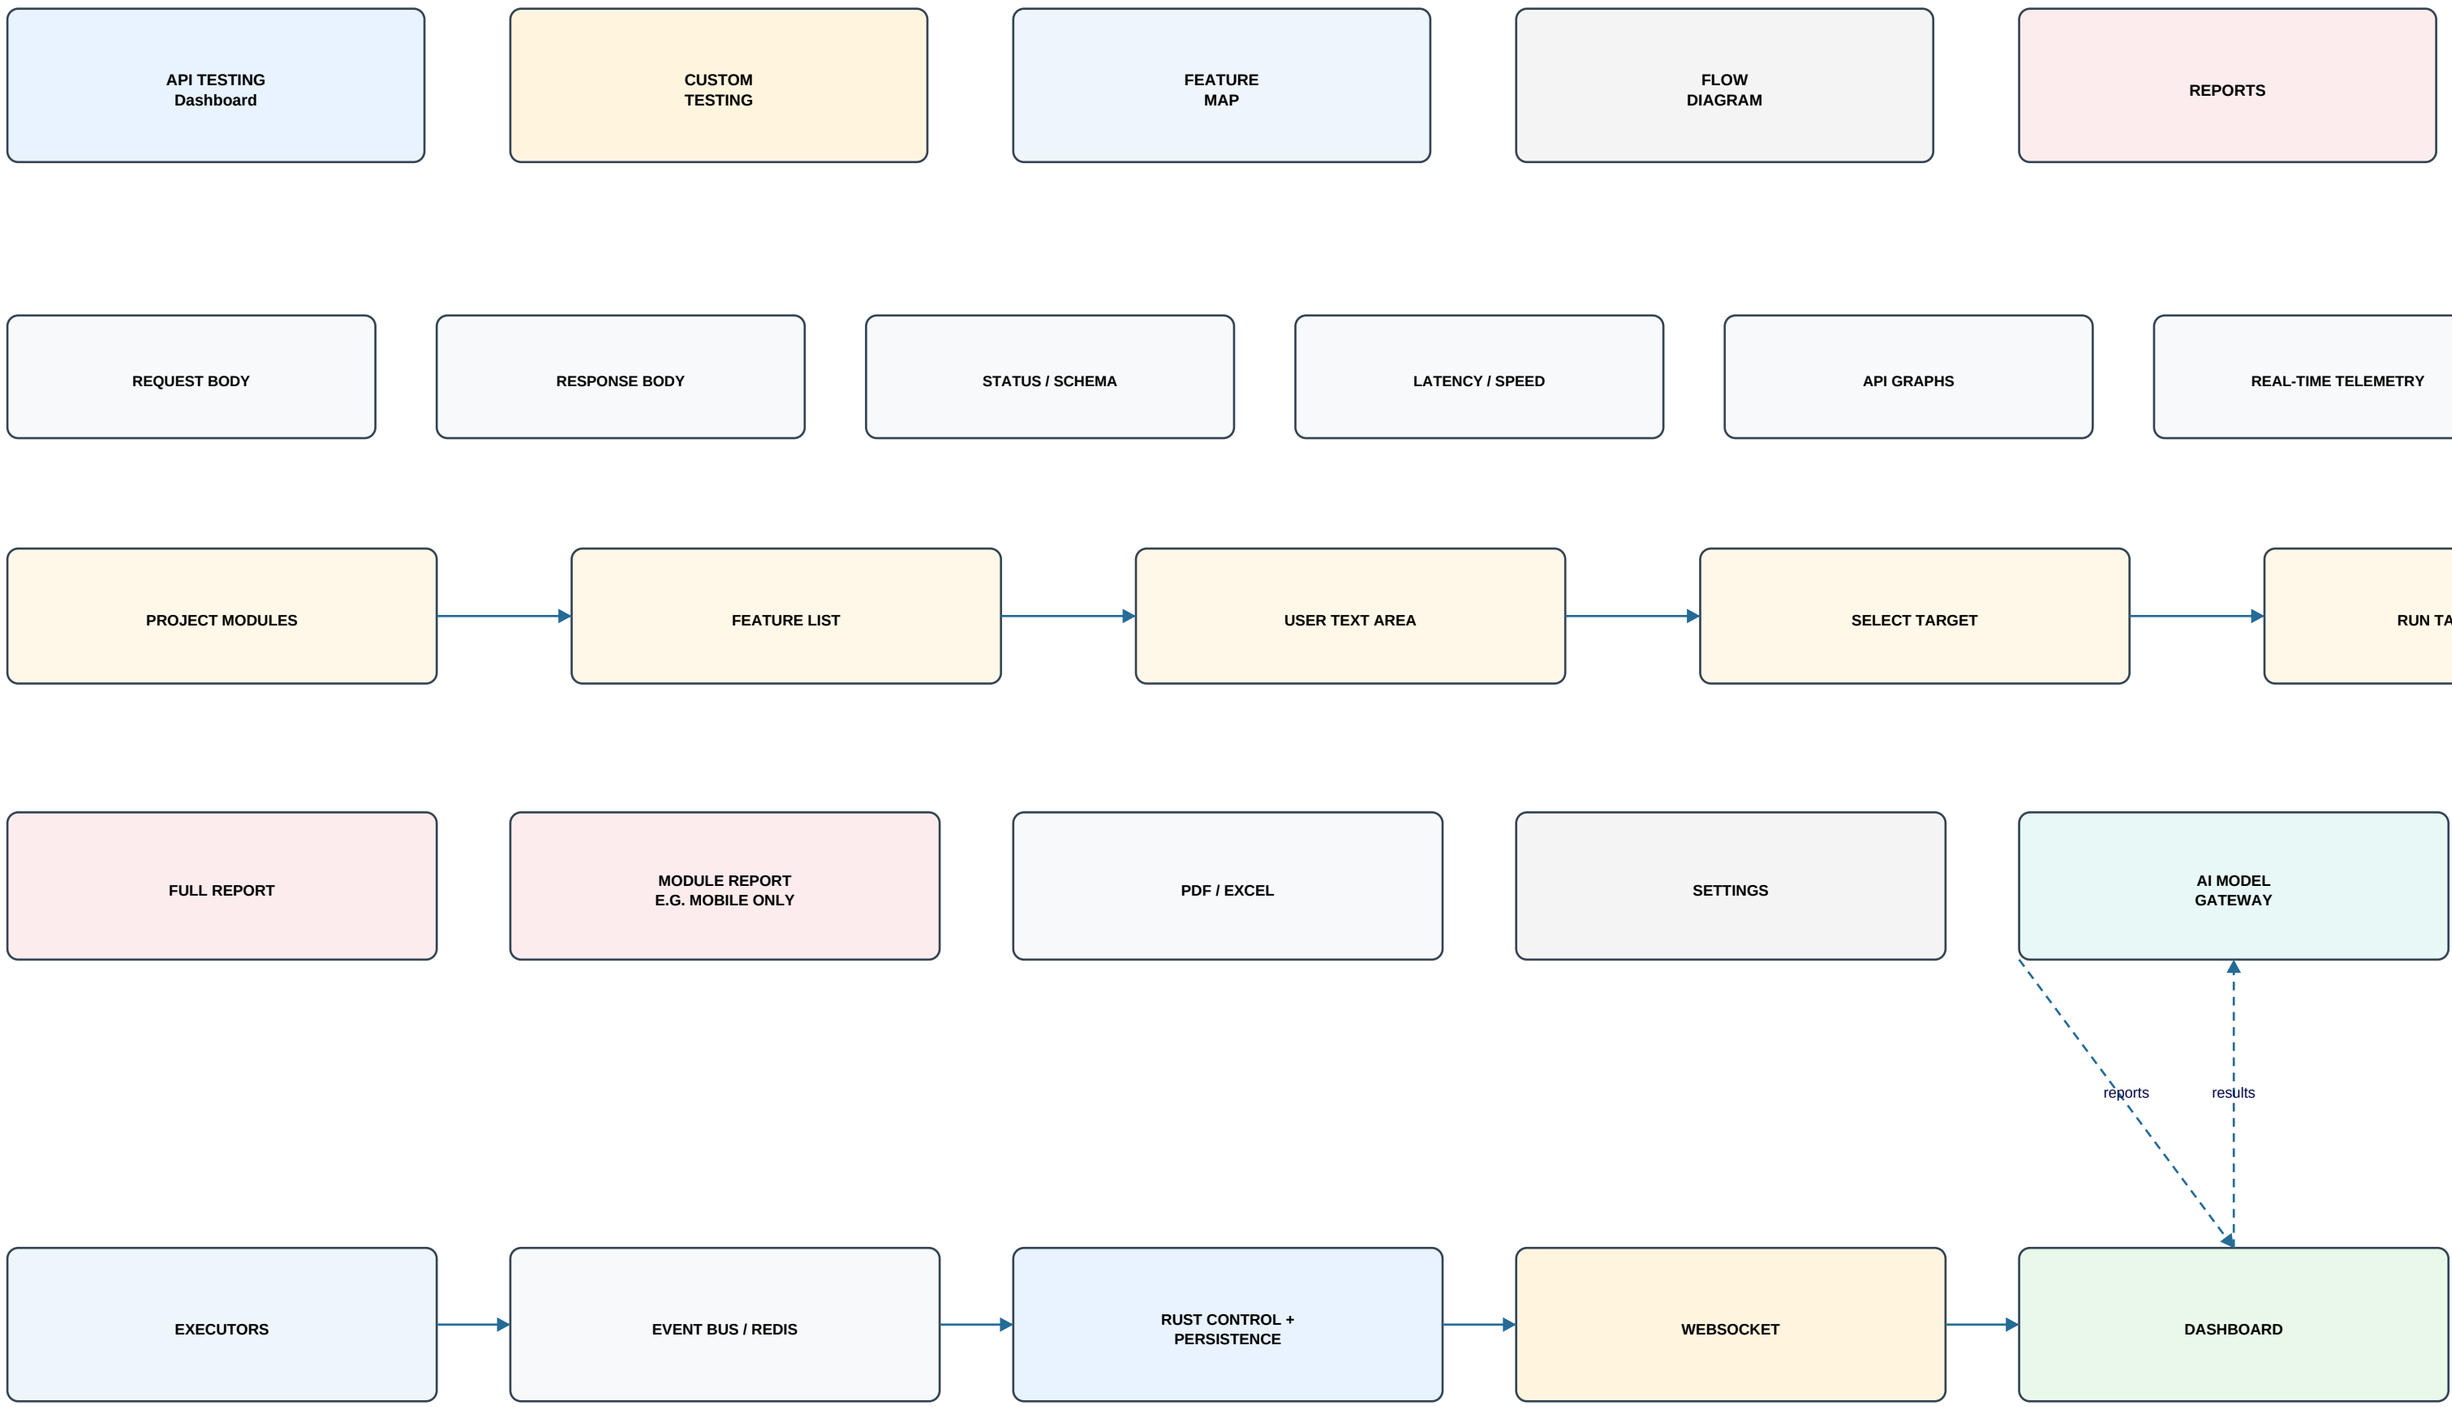
AIQA — Mobile Testing: Complete Dedicated Flow

Mobile module consumes generated cases; UI/UX cases are excluded from this execution path



AIQA — Supporting Modules + Data / Real-Time / Reporting Flow

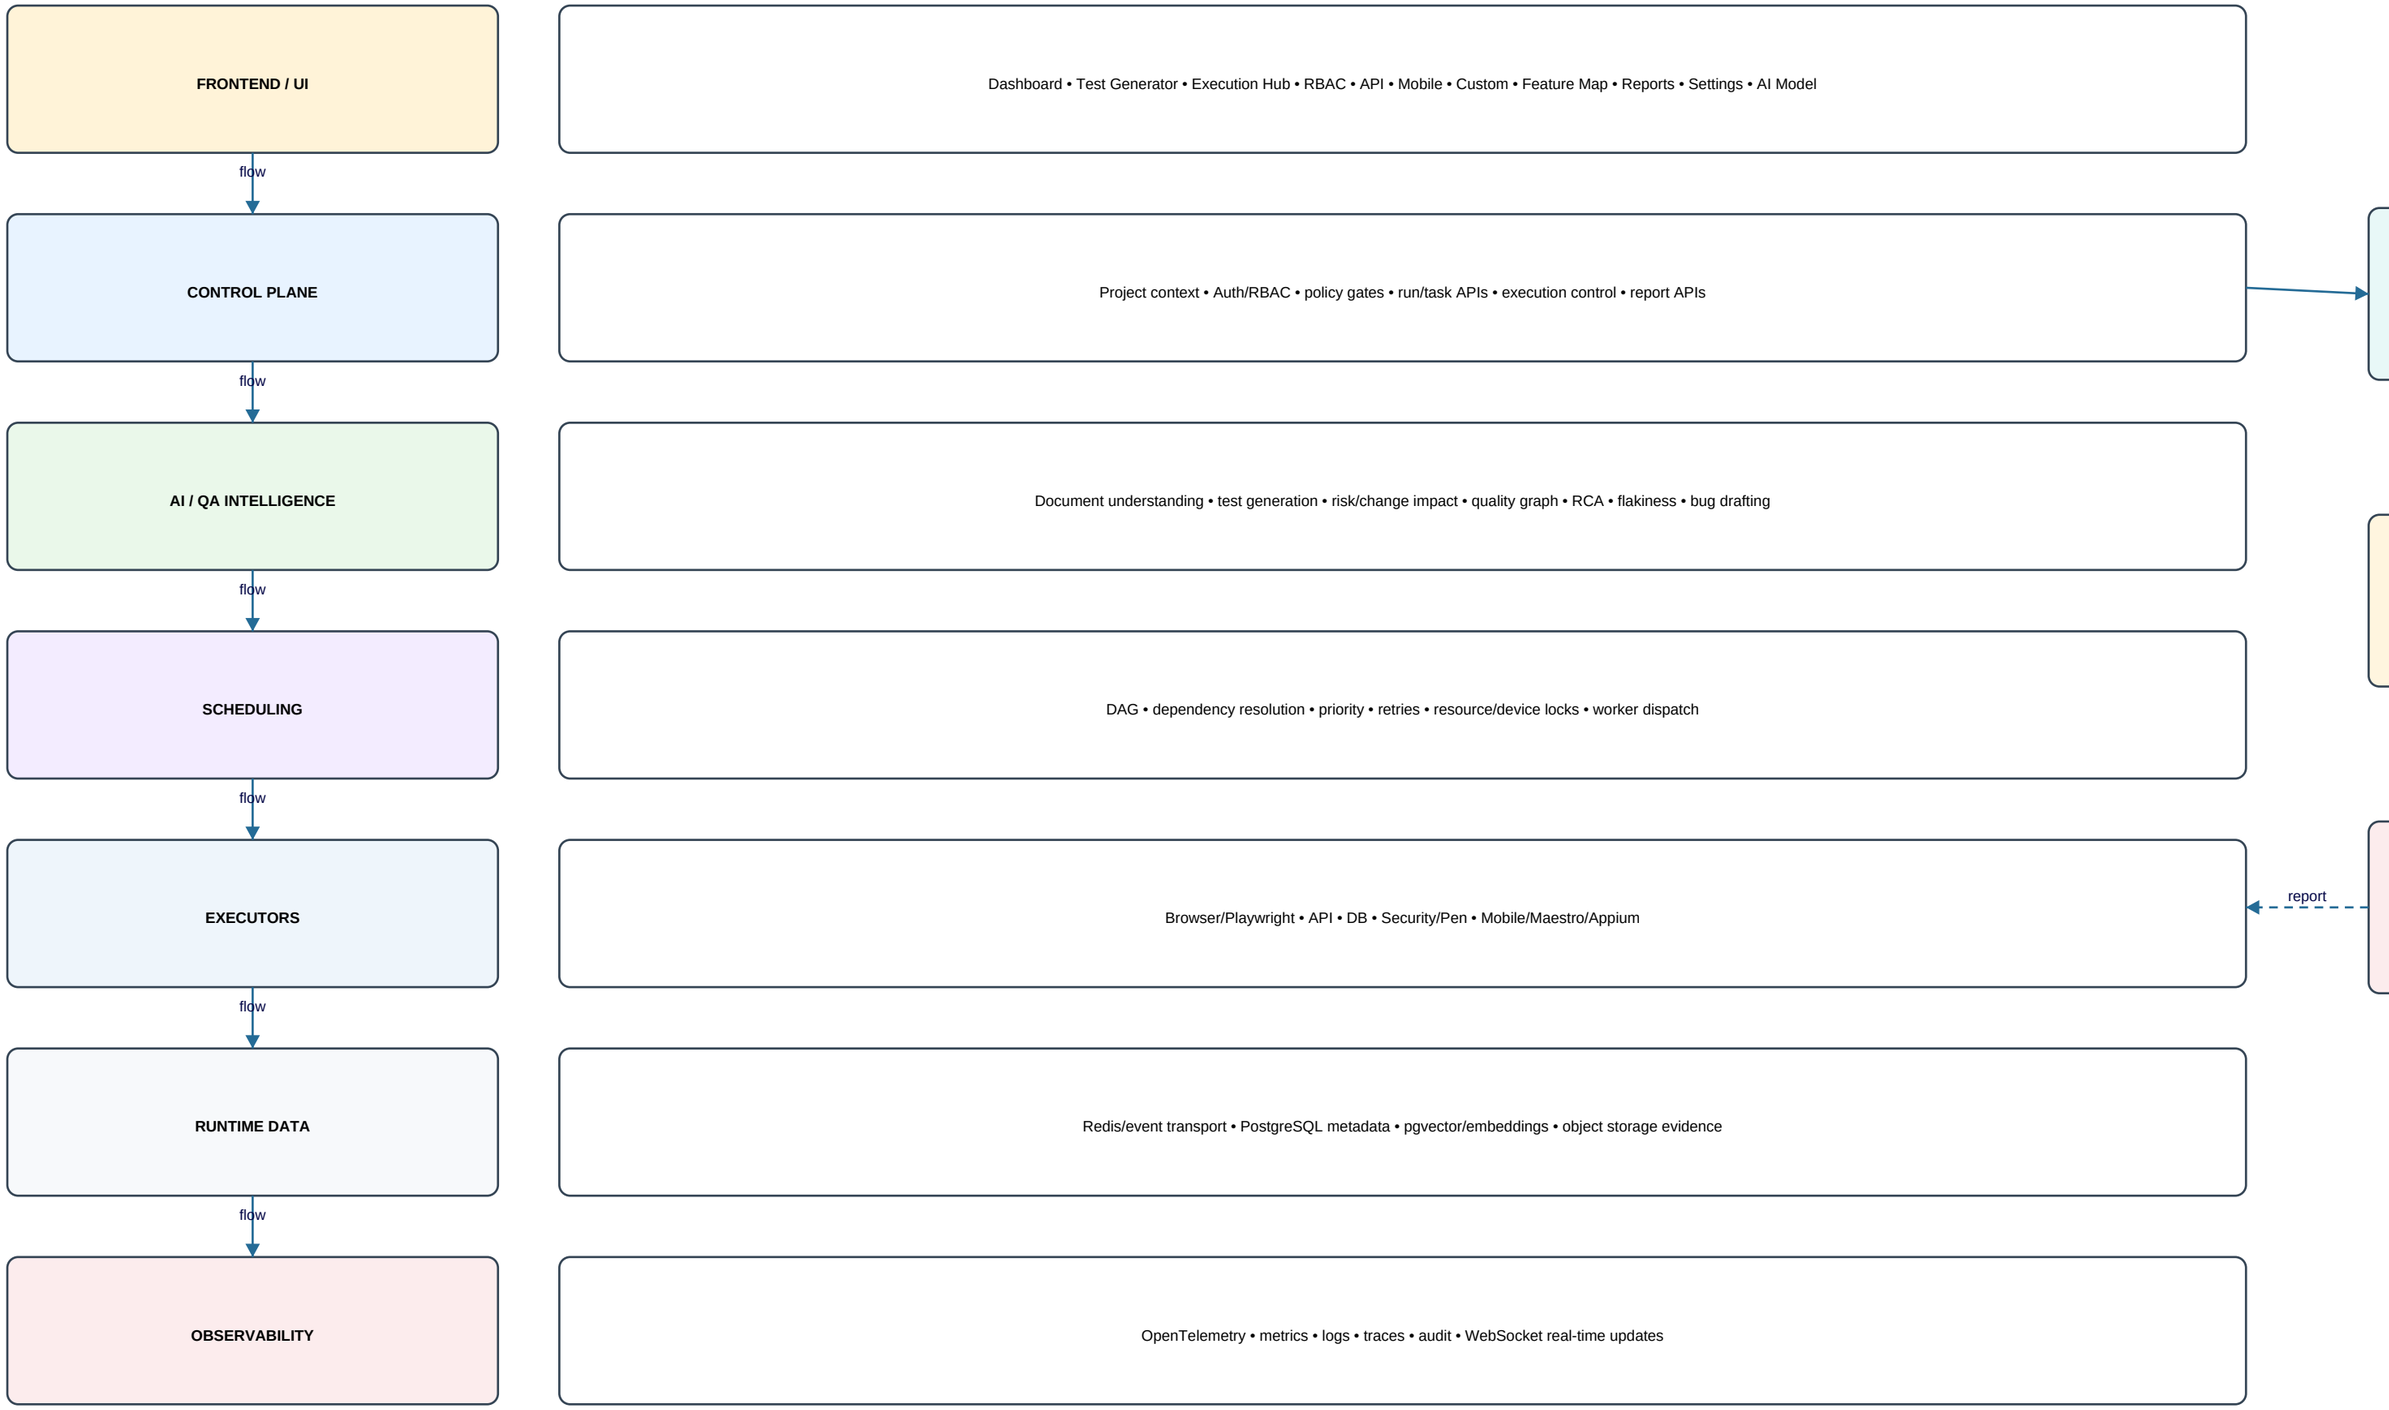
Completes the product flow beyond generation and execution



End-to-end principle: one selected project controls scope across every module; execution produces durable evidence, real-time events, analytics and module/full reports. Settings and AI Model Gateway control runtime behavior.

AIQA — Technical Master Flow

UI → Control Plane → AI/QA Workers → Scheduler → Specialized Executors → Events → Evidence → Reports



Coverage included: Dashboard • Test Case Generator • all test categories • RBAC • Execution • API • Mobile • Custom • Feature/Flow • Reports • Settings • AI Model • real-time/recovery/evidence.
